

# MEETING ROOM MANAGER - FORMAL TECHNICAL CHANGELOG

---

## 1. Purpose

This document is for anyone looking to review, reference or improve the Meeting Room Manager tool and can use the changelog to get an idea of how the project evolved over time.

---

## 2. Scope and normalisation

This changelog is based on the uploaded script set from MRM 01.00.txt through MRM 13.txt, normalised into **canonical milestones** so duplicate or near-duplicate files do not create false version noise. The clearest exact duplicate pair in the uploaded set is MRM 01.01.txt and MRM 01.02.txt, which represent the same effective prototype milestone and should be treated as one revision in the changelog.

This document is written as a **technical changelog**, not a raw diff log. It records the major retained changes that shaped the final tool rather than every intermediate formatting or wording edit. The final uploaded build is Meeting Room Manager **Version 2.3**.

---

## 3. Technical changelog by revision

### Revision A — Legacy interactive wizard (MRM 01.00)

#### Added

- Introduced the original **interactive meeting room wizard** model, driven by direct operator prompts rather than workbook input. The script synopsis and helper set show an end-to-end manual flow for room identity, place attributes, booking settings, approval/delegate handling, room list creation, and admin DL handling.
- Added manual helper functions such as Ensure-AdminDL, Ensure-RoomList, and Set-RoomCalendarDefaults, establishing the first complete proof-of-concept for Exchange room provisioning in a single script.

#### Status

- This revision is the **concept baseline**, but its direct-input wizard model was later superseded by the workbook-driven manager architecture. The underlying business objective survives; the user interaction model does not.
- 

### Revision B — Stateful prototype framework (MRM 01.01 / MRM 01.02)

#### Added

- Introduced the structured script-scope configuration object `$script:MRM`, separating **Defaults**, **Paths**, and **Runtime** into a consistent framework.
- Added automatic creation of **logs**, **state**, **preview**, and **reports** directories, plus transcript path generation.
- Added transcript-safe execution, central log writing, JSON state helpers, preview/report path generation, and run-context scaffolding.
- Added an Exchange Online bootstrap pattern with module installation/import logic and explicit connect/disconnect wrappers.
- Added the first recognisable Excel import framework with worksheet-based reading against the fixed sheet name Add New Meeting Rooms.

#### Changed

- Replaced the manual one-off wizard style with a more modular, state-aware architecture intended to support repeatable workbook-driven processing.

#### Status

- This revision establishes the **framework** later retained by the final tool, even though the operator-facing shape was still prototype-grade.

### Revision C — First chunked workbook-driven MVP (MRM 02)

#### Added

- Introduced the first clear **chunked MRM-Provision MVP** structure, with the tool explicitly organised around bootstrap, workbook import, schema handling, and workbook-driven runtime behaviour.
- Added a GUI workbook picker using `System.Windows.Forms.OpenFileDialog`, formalising the workbook as the main input path for the tool.
- Added explicit worksheet schema validation against required headers, making the workbook contract enforceable rather than implied.

#### Changed

- Changed the tool from a manual prompt-first workflow into a **workbook-first provisioning model**.

#### Status

- This revision is the first **stable workbook-driven baseline**. The workbook/worksheet contract introduced here remains a core dependency of the final tool.

### Revision D — Operation-aware schema milestone (MRM 03)

### Added

- Added **operation-aware schema validation** by making Get-MrmRequiredColumns depend on the requested operation, rather than using a single monolithic required-column set.
- Added a distinct minimal schema path for **Delete**, using Resource Email Address as the required header for that operation.

### Changed

- Changed workbook validation from a single shared schema into an operation-sensitive model, which is a major step towards the later final create/modify/delete contract.

### Status

- This revision is the first clearly visible milestone where the tool's workbook dependency becomes **operation-specific** rather than generic. That design is retained in the final release.

---

## Revision E — Mid-MVP refinement branch (MRM 04 to MRM 10)

### Added / matured

- Continued refinement of the chunked workbook-driven engine while retaining the same overall MRM-Provision architecture, fixed worksheet contract, and workbook-first runtime model.
- Continued consolidation of the create/modify/delete branch structure, including the workbook-validation and execution pattern that later stabilises in the Meeting Room Manager releases.

### Changed

- This branch represents iterative refinement rather than a clean major-version jump. The visible excerpts show the same core workbook-driven branch evolving, rather than multiple distinct product shapes.

### Status

- No single isolated finalised feature boundary is obvious from the visible excerpts within this cluster. For changelog purposes, it is best treated as the **consolidation branch** between the first MVP and the later branded manager releases.

---

## Revision F — Meeting Room Manager v2.2 baseline (MRM 11)

### Added

- Introduced the **Meeting Room Manager** tool identity, replacing the generic MRM-Provision MVP naming with a clear operator-facing product name.

- Added the clearly branded four-operation banner model: **Create / Modify / Delete / Check**.
- Added a thinner **Create** schema and a fuller **Modify** schema in clearly differentiated form, formalising the intended split between mailbox creation and later enrichment/finalisation.

#### Changed

- Changed the operator-facing tool from an MVP/construction identity into a more recognisable operational manager.
- Changed schema handling into the later mature shape where Create is intentionally minimal and Modify is intentionally comprehensive.

#### Status

- This revision is the first strong **modern baseline** of the tool as users now recognise it. The later releases mostly extend and harden this shape rather than replacing it.

---

### Revision G — Pre-final robustness hardening (MRM 12)

#### Added

- Added stronger workbook text normalisation in ConvertFrom-MrmExcelCellValue, including CR/LF/TAB replacement, non-breaking-space cleanup, zero-width/BOM removal, repeated-whitespace collapsing, and final trimming.

#### Improved

- Improved resilience of workbook-driven processing against poor-quality Excel input and copied text artefacts.

#### Status

- This revision is a **hardening milestone** rather than a workflow redesign. It improves robustness of the existing architecture and is carried forward into the final build.

---

### Revision H — Final uploaded build / Version 2.3 (MRM 13)

#### Added

- Added MaximumDurationInMinutes = 1440 to the script defaults, making 24-hour booking duration an explicit first-class configuration value rather than an unstated assumption.
- Added a dedicated **results** folder beside the existing working folders and extended runtime state with LastCheckResults.

- Added the operator-facing **pre-requisites banner**, explicitly stating that Exchange Administrator JIT must be active, Modify requires an existing Read and Manage admin DL, and the workbook must meet the required worksheet and schema contract.
- Added final release-style check/reporting support, including results export capability tied to the last check result set.

#### Changed

- Changed the banner content from a generic bootstrap/EXO/workbook-picker description into a more operationally useful pre-requisites block.
- Changed the overall tool identity from Version 2.2 to the final uploaded Version 2.3.

#### Improved

- Improved operator usability by making tool pre-requisites explicit at startup.
- Improved reporting/audit capability through generated results artefacts rather than relying only on console output.
- Improved booking-policy control and room verification by formalising **Maximum Duration** as both a setting and a reported value.

#### Status

- This is the **final uploaded build** and should be treated as the current release reference point for handover and technical documentation.

---

## 4. Retained technical features in the final release

The final Version 2.3 release retains the following major technical capabilities:

- Structured runtime configuration through \$script:MRM.
- Automatic path creation for logs, state, preview, reports, and results.
- Transcript-safe logging and centralised file/console log output.
- Exchange Online bootstrap handled internally by the script.
- Workbook-driven create and modify workflows with a fixed worksheet contract.
- Operation-aware schema validation.
- Menu-driven Create / Modify / Delete / Check workflow.
- Maximum-duration configuration and reporting.
- Results export and retained check-result state.

---

## 5. Superseded technical features

The following earlier technical patterns were **superseded** and are not part of the final retained operating model:

- The **fully manual interactive wizard** used in MRM 01.00, where the operator entered room details directly into prompts rather than through a workbook.
- The **prototype “PART 1 OF 4” presentation model** in MRM 01.01 and MRM 01.02. Its useful internal framework elements survived, but the product shape itself did not.
